SUMMARY

Early-career data scientist with a business-statistics background. I build projects end to end, from raw data and SQL through evaluated models to something a person can use, and I report results against baselines, with their limits stated. Open to junior, internship and research roles in Korea and with international, English-speaking teams.

SELECTED PROJECTS

Telco Customer Churn — Classification · retention · 2026 · Complete

- Built the whole pipeline myself: cleaning, feature engineering, stratified cross-validation of three classifiers, threshold analysis, one persisted scikit-learn Pipeline, and a Streamlit app that turns a score into a risk band and an action.
- Held-out test ROC-AUC 0.842 and recall 0.791: 296 of 374 churners caught. Chosen over a random forest with higher accuracy that missed more than half of them.

Python · pandas · scikit-learn · joblib · Streamlit · github.com/shavkatjony/telco-c-classifier-alias

Olist Marketplace: Delivery & Loyalty — SQL-first analytics · 2026 · Complete

- Loaded the 9 raw tables into SQLite, wrote the analysis in SQL (CTEs, window functions, cohort logic), and turned five business questions into charts, findings and recommendations.
- Only 3.12% of customers ever order again. On-time orders average 4.29 stars; orders 8+ days late average 1.73. The slowest state waits 29.4 days against a 12.6-day national average.

SQL (SQLite) · Python · pandas · matplotlib · github.com/shavkatjony/brazilian-e-market

Retail Commercial Intelligence — Data modelling · BI · 2026 · Working

- Designed a star schema with an explicit grain, staged DuckDB SQL, a data-quality build gate, a metrics engine with a transparent priority score, and a self-contained three-page HTML dashboard.
- At full M5 shape the build processed 59.1M rows end to end in 84 s, with peak memory cut from 8.8 GB to 2.6 GB. The business findings shown are illustrative: the repo runs on a synthetic, M5-shaped sample.

Python · DuckDB SQL · Parquet · Make · Tableau (guide) · github.com/shavkatjony/retail-commercial-intelligence

DPEC: Formula 1 Pace Intelligence — Forecasting under uncertainty · Formula 1 · 2026 · In development

- Wrote the plan, rules and architecture decisions, then built the first layer: a FastF1 ingestion CLI. It saves each session's raw tables as Parquet with a SHA-256 manifest, skips sessions already saved, and never requests one that hasn't happened yet.
- Working today: idempotent ingestion of seven raw tables per session, covered by 17 tests that run in CI on every push. Not built yet: the forecasting models, their calibration and the public ledger.

Python 3.12 · FastF1 · pandas · PyArrow / Parquet · DuckDB · Typer · pytest · GitHub Actions · github.com/shavkatjony/F1-pace-intelligence

EXPERIENCE

Data & Business Analyst, KVENTS — Nov 2024 – Dec 2025 · Chust, Namangan, Uzbekistan · remote

- Digitised sales, inventory and expense records into structured datasets in Excel and Google Sheets.
- Business and financial analysis of sales, inventory and costs.
- Time-series forecasts of sales and expenses to plan resources.

EDUCATION

Bachelor of Integrated Business Management (IBM) — Dong-A University, Busan, South Korea · 2026

Focus: Econometrics, business statistics and strategy, marketing research.

SKILLS

Languages	Python, SQL (SQLite, DuckDB)
Data & ML	pandas, NumPy, scikit-learn (pipelines, stratified CV), statsmodels (OLS, logit)
Data engineering	Parquet/PyArrow, DuckDB star schemas, data-quality gates, idempotent ingestion
Practice	pytest, ruff, uv, GitHub Actions CI, Makefiles, decision records
Delivery	Streamlit, matplotlib, self-contained HTML dashboards
Learning	Tableau, FastAPI, dbt, MLflow, R (coursework)
Spoken	Uzbek (native), English (fluent), Turkish (fluent), Korean (beginner, studying)
